# Preliminary Course Catalogue

# Bachelor Programme in Computer Science with 60-CP Minor Subject (INF-B-120)

120 credit points

According to the Examination Regulations

 $\operatorname{Version}(2014/12/18)$ 

#### About the Programme of Studies

The Bachelor programme in computer science prepares students for the professional practice in the field of computer science in application, manufacturing, research and teaching-related activities. The goal of the training is to develop the fundamentals of the subject in theoretical and practical aspects. The ability is to be developed to independently recognize and solve a variety of problems in information processing. Students acquire knowledge and methods in the central areas of computer science based on formal foundations. Moreover, with a wide variety of minor subjects, the programme is very application oriented. Upon completion of training the students should have knowledge about properties of information processing and the possibilities to describe them with formal methods. They should know about the structures and modes of action of information processing systems. In cooperation with the users they must be able to analyse complex tasks, formulated in the language of the application area, structure it, abstractly formulate, and present it in a way suitable to submit it to a mechanical solution. Of particular importance is the ability to adapt to changing application areas to adapt to the changing conditions of the practice of information processing, and to participate actively in the changes of the IT-world. The bachelor programme, among other things, lays the foundation for a research-oriented improvement of knowledge and skills in the master programme.

The core Computer Science part of the programme covers the main topics in this field, programming (Java) together with Software Engineering, Theoretical Computer Science (formal languages, computability, complexity theory, logic, algorithms and data structures), Database Technology (relational databases, index structures), Operating System, Computer Networks and Mobile Systemsy. A significant part of the basic courses is a practical training where small teams of students have to implement a complex piece of software.

The Bachelor programme consists of three parts: about fife nineth cover the core Computer Science topics. About one nineth comprises basic mathematical courses, inlinear algebra, basic topics from Analysis, and statistics. For the last one third a minor subject has to be chosen. The LMU offers an increasing number of minor subjects worth 60 credit point. All in all the Bachelor programme lasts six semesters and requires the students to acquire 180 credit points.

Most modules are compulsory. However, there are two so-called "special topics" modules. In the two with 6 ECTS-points assessed modules, students can choose from a wide range of in-depth courses in Computer Science, Media Informatics and Bioinformatics. The concrete contents of the courses may vary from semester to semester. They are usually determined by the current research of teaching staff and thus serve the implementation of the principle of research orientation in teaching: By taking courses in the field of in-depth topics, students are introduced to current research questions and gain insight into the development of the research area. In order to promote excellent students, students in the Bachelor programme are already offered the possibility to visit courses that are especially designed for master students (- the descriptions of these modules contain information about the prerequisits for visiting them as a Bachelor student). The achievable level of competence includes the ability to collaborate with the Master students and thereby to be able to make the first valuable contributions.

Nine further credits have to be acquired from an offer of (more or less) soft skill modules, (ethics, legislation, personal and social competence, IT-competence, tutoring jobs etc.). The Bachelor thesis in the last semester earns 12 credits plus 3 credits for the final presentation. The Bachelor thesis in the last semester earns 12 credits plus 3 credits for the final presentation. The final mark is obtained separately from the ECTS-weighted marks in the major subject (Computer Science and Mathematics) and from the ECTS-weighted marks in the minor subject. Modules with 24 credits in total where the student got the worst marks are ignored when computing the final grade.

#### Start of studies: WiSe.

# 1 Explanations

CP	Credit Points
ECTS	European Credit Transfer and Accumulation System
h	hours
SoSe	summer semester
WiSe	winter semester
SWS	credit hours
GOP	Qualifying Examination (Grundlagen- und Ortientierungsprüfung)

- 1. Please note: The course catalogue serves as an orientation only for your course of study. For binding regulations please consult the official examination regulations. These can be found at www.lmu.de/studienangebot for the respective programmes of study.
- Modules whose identifier starts with P are mandatory modules. Modules whose identifier starts with WP are elective modules. Modules whose identifier starts with VT are additional offerings not listed in the examination regulations.
- 3. One of the GOP-marked (Grundlagen- und Ortientierungsprüfung) examinations must be passed by the 3rd semester.

# 2 Regular Modules

The subsequent list of modules corresponds to modules in the examination regulations. If in the list of required or elective modules individual numbers are missing, these are placeholders for Special Topics modules.

# 2.1 P 1: Introduction to Programming (INF-EiP)

Responsible for Module	Prof. Dr. Hans Jürgen Ohlbach
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

This module provides an introduction to the imperative, object-oriented and concurrent programming using a high level language, e.g. Java. In addition to the knowledge of general programming principles, concepts, methods and techniques for displaying, structuring and processing of data and the development of algorithms are discussed. Particular emphasis is set on conceptual clarity and precise mathematical foundation with formal methods.

The main topics of the course are as follows:

- basic concepts about programs and their implementation;
- syntax of programming languages and their description;
- basic data types and imperative control structures;
- complexity and correctness of imperative programs;
- recursion;
- simple sorting methods;
- introduction to the object-oriented program design;
- classes, interfaces and packages;
- inheritance, and exception handling;
- object-oriented implementation of lists and tree structures;
- basic concepts of concurrent programming: threads, synchronization and deadlock,
- Introduction to UML-Diagrams,
- Programming with an Integrated Development Environment (currently Eclipse).

#### **Recommended Literature**

There is a multitude of introductory books about Computer Science and Java in particular. A comprehensive Java book, which is also online available, is:

- Java ist auch eine Insel, von Christian Ullenboom, Gilileo Computing, ISBN = 978-3-8362-1802-3

An easier introductory book is

• Java kompakt, von Hözl, Read und Wirsing, Springer Vieweg, ISBN 978-3-642-28503-5

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

### **Qualifikation Aims**

The students will be able to implement solutions for small and manageable problems algorithmically and to realize them with a high level programming language as executable programs. Using an IDE like Eclipse facilitates the professionalisation. Furthermore, students develop an understanding of the general principles of programming and programming languages. This lays the foundation to ensure that the students (after further experiences in the course of study) may become familiar quickly and accurately with any programming language.

# 2.2 P 2: Foundations of Analysis for Computer Scientists (INF-GAI)

**Part of:** Bachelor Programme in Computer Science with 60-CP Minor Subject (120 CP) Associated Module Components:

Teaching	Component	Rota	Attendance	Selfstudy	ECTS
lecture	Lecture: Foundations of Analysis for Computer Scientists	WiSe	30 h (2 SWS)	30 h	2 CP
exercise	Exercises: Foundations of Analysis for Computer Scientists	WiSe	15 h (1 SWS)	15 h	1 CP

Type	compulsory module with compulsory module components
Entry Requ.	none
Time during the study	1. Semester
Duration	The module comprises 1 semester.
Grading	
Type of Examination	The module examination consists of the course examinations. Lecture: Foundations of Analysis for Computer Scientists: Klausur (45-90 Minute) oder mündlich (15-30 Minute) Repeatability: arbitrary, Admission Requirements: none
Responsible for Module	Prof. PhD Martin Hofmann
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

The module complements the course "Linear Algebra for Computer Scientists" by topics of Analysis which are important for Computer Science. The students should be able to understand them and to put them into perspective when they occur in advanced modules. The teaching of logical-mathematical foundations and proofs is therefore largely unnecessary.

The topics in detail are:

- sequences and series, limits,
- complex numbers,
- trigonometric and exponential functions,
- integral calculus in one variable,
- Fourier series, discrete Fourier transform,
- partial derivatives, gradient, Hessian matrix, .

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

# **Qualifikation Aims**

The students learn to determine the limits of sequences and series, and to apply citeria for convergence. They should be able to calculate with complex numbers, and know the relationship between trigonometric and exponential functions. After revising the integral calculus familiar from school, the concept of Fourier series will be introduced using orthogonality relations. In this context the discrete Fourier transform will be presented and demonstrated with applications.

Duration	The module comprises 1 semester.
Grading	marked

Type of Examination	Klausur (90-180 Minute) oder mündlich (15-30 Minute) Repeatability: once, next chance, Admission Requirements: none Qualifying Examination (Grundlagen und Orientierungsprüfung), also for INF-NF-60
Responsible for Module	Dr. Matthias Schubert
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

The module gives an introduction to the development of efficient algorithm as well as the interaction between algorithms and data structures.

#### Basic Principles of Algorithms and Runtime Analysis

- Different types of runtime approximations (best-case, worst-case, expected runtime)
- Asymptotic analysis of upper and expected complexity bounds
- Big O notation (Definition and computation)
- Important complexity classes(constant, logarithmic, linear, quadratic, and exponential)
- Methods for empirical performanz evaluation
- Time and space trade-off.

#### **Optinal Topics:**

- Little o, big omega and big theta notation
- Recurrence relations
- Analysis of iterativ and rekursiv algorithms
- Some version of a Master Theorem.

#### **Basic Data Structures and Algorithms**

- Elementary data types (integer, float, strings etc.)
- Records, objects and arrays
- dynamic data structurs ( singly and doubly linked lists, stacks, queues, trees)
- Implementations of dynamic data structures
- simple numerical algorithms (e.g. computing the average, maximum, or mininum of a list Liste or an array approximative computation of the square root, computing the greatest common divisor)
- sequential and binary search in arrays.

### Data Structures and Algorithms for Key-Searching

- Connection between search, insertion and delete times and memory requirements.
- Balanced search trees (principles and analysis, example structures e.g. AVL-trees, red-black trees)
- Search trees for the secondary storages (basic setting, B-trees)
- Principles of hashing ( simple hashing functions, basic collision strategies)
- Dynamic hashing methods (e.g. linear hashing).

#### **Optional Topics:**

- Advanced algorithmens for key search in main memory (e.g. optimal binary search trees, splay trees, treaps)
- Advanced index structures for key search in the secondory storage (e.g. B\*-trees)
- Advanced hashing methods (e.g. linear hashing with partiell extensions).

#### Sorting Methods

- Basice sorting algorithms (counting sort, insertion sort, selection sort, bubble sort)
- Advanced sorting algorithms (heapsort, quicksort)
- Sorting algorithms for the secondary storage (merge sort)
- Lower bounds for sorting based on key comparisons
- Key based sorting (bucket sort).

#### **Optional Topics**

- Advanced methods for sorting large key sets (button-up heapsort, clever wuicksort)
- Advanced key-based sorting methods (radix-sort)
- Priority queues (heaps, Fibonacci heaps).

#### **Graph Algorithms**

- Basic characteristics of graphs
- Graph representations (Adjanzenzmatrix, Adjanzenzlisten)
- Graphd traversals( breadth first, depth first)
- Shortest path computation (Dijkstra's and Floyd's algorithms)
- Minimal spanning trees(Prim's and Kruskal's algorithm).

#### **Optional Topics:**

- Network flows (e.g. maximal flow, max-flow–min-cut theorem, maximal bipartite matching)
- further graph problems(e.g. topological sorting, finding strongly connected components, graph matching).

### **Algorithmic Strategies**

- Exhaustive search
- Greedy algorithms
- Divide-and-conquer
- Recursive backtracking
- Branch-and-bound.

### **Optinal Topics**

• reduction: Transform-and-Conquer.

### **Optional Chapters**

- Linear programming (duality, simplex algorithms, interior point methods)
- Pattern matching and string/text algorithms (e.g. substring matching, regular expressions, longest common subsequence)
- string based data structures and algorithms (e.g. suffix arrays, suffix trees, tries)
- advance numerical algorithms (e.g. primality tests, integer factorization)
- geometric data structures and algorithms (e.g., points, line segments, polygons, finding convex hull, spatial decomposition, collision detection, geometric search/proximity).

### Literature

- R. Sedgewick: Algorithmen in Java, 2. edition, Pearson
- T. Ottmann, P. Widmayer: Algorithmen und Datenstrukturen, 4. edition, Spektrum Akademischer Verlag, 2002
- T. H. Cormen, C. Leiserson, R. Rivest, C. Stein: Algorithmen Eine Einführung, 4. Auflage Oldenbourg, 2013

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

# **Qualifikation Aims**

With completing this modul participants should be familiar with the following topics:

- Basic characteristics and development method for algorithms
- Efficient algorithms and data structures for basic problems
- Important complexity classes for the analysis of runtime and memory complexity.

Participants of the module should be able to:

- Analyze the run time and memory requirements for a given algorithm.
- Formally model and described algorithic problem settings
- Adapt the introduce data structures and algorithms to modified problem settings.

Based on the learned knowledge and abilities the participants obtain the skill to:

- Develop and implement programs based on the introduced algorithmic techniques in a programming language
- Evaluate different solution approaches for a given problem based on formal analysis.

# 2.4 P 4: Logic and Discrete Structures (INF-LDS)

Type of Examination	Klausur (90-180 Minute) oder mündlich (15-30 Minute) Repeatability: once, next chance, Admission Requirements: none Qualifying Examination (Grundlagen und Orientierungsprüfung), also for INF-NF-30, INF-NF-60

Responsible for Module	Prof. PhD Martin Hofmann
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

The module provides basic knowledge of discrete mathematics and logic as far as it is relevant for further informatics modules.

The main topics of the course are as follows:

- Discrete Mathematics: modular arithmetic, solving modular equations, recurrences, partial orders;
- Logic: propositional logic, predicate logic, syntax, semantics, proof calculi, correctness and completeness of logical systems, resolution.

The module consists of a lecture and exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

#### **Qualifikation Aims**

Students should understand and apply the presented concepts and methods of discrete mathematics as far as they are relevant to informatics. Through the example of predicate logic they should grasp the differences between syntax and semantics, and between truth and provability. They should become able to understand advanced logical formalisms presented in further modules, or acquire them later through self-study.

# 2.5 P 5: Formal Languages and Complexity Theory (INF-FSK)

### Remarks

The module is an essential basis for advanced modules in the field of theoretical computer science and formal software engineering. Anfang

Grading	marked	

Type of	Klausur (90-180 Minute) oder mündlich (15-30 Minute)
Examination	Repeatability: arbitrary, Admission Requirements: none

Responsible for Module	Prof. Dr. Hans Jürgen Ohlbach
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

The module provides basic knowledge in the areas of formal languages, computability and complexity theory.

The main topics of the course are as follows:

- automata and formal Languages: Chomsky hierarchy, regular languages and finite automata, context-free languages and pushdown automata, context-sensitive languages;
- computability: Turing machines and other models of computation, undecidability, halting problem, recursively enumerable problems;
- complexity theory, especially the classes P and NP, definition and proof of NP completeness, examples of NP-complete problems.

#### **Recommended Literature**

• Theoretische Informatik kurzgefasst, Uwe Schöning, Spektrum Hochschultaschenbuch, ISBN 978-3-8274-1824-1

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

### **Prior Knowledge**

Basic knowledge from the mathematics lectures.

#### **Qualifikation Aims**

The students should learn the above mentioned recurring theoretical foundations of computer science and are able to apply them to practical problems. Examples are, to identify a problem as NP-complete, or to identify state-based specifications as finite automata, and to apply determinisation and minimisation methods.

In addition the students deepen their abilities to understand abstract theoretical topics and to understand mathematical proofs.

# Remarks

The module is an essential basis for advanced modules in the field of theoretical computer science and formal software engineering.

Type of Examination				

Responsible for Module	Prof. Dr. Rolf Hennicker
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science Programming and Software Engineering Group
Teaching Lang.	German, English

This module introduces the fundamental principles of software engineering. The entire software development process is presented, starting with requirements analysis, system design, to implementation and testing. As a graphical modeling language, the Unified Modeling Language (UML) is used in all phases of the development process. The implementation language is Java.

The main topics of the module are as follows:

- software development processes;
- requirements analysis with use cases;
- design of static system structures with class diagrams;
- modelling behavior with state machines, sequence, and activity diagrams
- architecture of complex software systems;
- design and architectural patterns;
- relationship between models and implementations in object-oriented languages;
- software testing.

The module consists of a lecture and of additional exercises in groups. The concepts introduced in the lecture are practiced in the exercise class with concrete application examples.

#### **Qualifikation Aims**

The students will acquire a general understanding of the major aspects of modern software engineering using notions and tools that are currently researched in academia and employed in industry. They will be able to model static and dynamic properties of complex systems and to transfer the models into software.

# Contents

The foundations of probability theory and statistics relevant to computer science and bioinformatics are discussed. Fundamental concepts like probability, distributions for discrete and continuous random variables, conditional probabilities and conditional distributions, Markov chains, independence and correlation as well as the principles of statistics inference for discrete and continuous random variables are introduced.

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

### **Qualifikation Aims**

This course provides a theoretical understanding of the principles of probability theory and statistics. In particular, central concepts like probability, distribution, independence and correlation are understood in a subject-matter context.

The seminar focuses on current developments and research topics in Computer Science.

One or two students select an individual topic from computer science. The students must research this topic, prepare a paper and a talk. They present the talk to the other students and face a critical discussion.

# **Qualifikation Aims**

The students learn to investigate a complicated topic by themselves. Special emphasis is also on practicing presentation and lecture techniques.

# 2.9 P 9: Special Topics for Bachelor I (INF-B-VT1)

This is the first of two so-called "abstract" modules in the Bachelor programme. In both with 6 ECTS credits rated modules, students can choose from a wide range of in-depth courses in Infomratics, Mediainformatics and Bioinformatics. The concrete contents of the courses can vary from semester to semester. They are usually inspired by the teaching staff's research and thus serve the principle of research orientation in teaching: By visiting in-depth modules, students will be introduced to current issues in research and gain insight into the development of the field. In order to promote excellent bachelor students they are already opened the possibility to visit master level modules (- appropriate characterization is done in the module descriptions, in particular whether it is necessary to have already provided excellent achievements in previous studies). The achievable level of competence is the proven ability to work together in dialogue with master level students and thereby to be able to bring in first valuable contributions.

# **Qualifikation Aims**

By visiting special topics modules, students acquire the basic ability to understand university research: The introduction to current research projects of teachers, in particular, makes the students aware of how to deal with scientific issues and enables them for developing first own ideas for advanced learning processes.

Responsible for Module	Prof. Dr. Christian Böhm
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science Database Systems Group
Teaching Lang.	German

The course provides an introduction to the field of database systems from a user's perspective. It focuses on the theoretical aspects of the relational database design using the relational data model, relational algebra and the relational calculus. There is a detailed treatment of the SQL query language, which is implemented in most relational systems. Further topics are formalisms, algorithms and a theory of relational design theory, as well as newer applications in the area of databases.

The main topics of the course are as follows:

- relational and object-relational data as well as other models;
- Relational Algebra;
- tuple calculus and domain calculus;
- SQL;
- database design for the E/R model;
- normalforms;
- transactions including synchronization and recovery techniques;
- physical database design (index structures and query optimization);
- integration of database operations in application programs.

The module consists of a lecture and exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

#### **Qualifikation Aims**

The students are able to apply database systems professionally as user, as application programmer and as system designer. They are taught the skills to do focused research in large databases using complex queries, to develop database schemes avoiding redundancy problems and taking into account efficiency aspects, and to implement efficient database applications.

Teaching Lang.	German

This module provides an introduction to the relevant components of modern operating systems and the needed foundations of computer architecture. It begins by outlining methods for process management and process control, especially concurrent processes. In particular, methods for detection and avoidance of conflicts (deadlocks and race conditions) are treated with concurrent access to shared resources.

### The main topics of the course are as follows:

- the history of operating systems;
- the interaction between the lower level components of a computer;
- technical foundations of machine programs, subprograms, procedures and recursive procedure calls;
- strategies for process management in operating systems;
- the support of the operating system for parallelizing programs;
- strategies for Resource Management and coordination of processes;
- techniques for memory management and control of input and output channels;
- local and distributed inter-process communication.

#### Recomended Literature:

- William Stallings, Operating Systems: Internals and Design Principles, Prentice Hall, 7th Edition, 2011, ISBN-13 978-0132309981
- A.S. Tanenbaum, Modern Operating Systems, Prentice Hall, 3rd Edition, 2007, ISBN-13 978-0136006633
- A. Silberschatz, P. Galvin, J. Peteron, Operating System Concepts, John Wiley and Sons, 8th Edition, 2011, ISBN-13 978-1118112731

The module consists of a lecture and exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples. In addition, the students do exercises, which deepen the application of theoretical concepts in high-level languages.

# **Qualifikation Aims**

This module provides students with the necessary basic knowledge for the specific use of the special structure and properties of modern operating systems. It lays the foundations for the development of optimized and scalable computer programs for modern operating systems.

Teaching Lang.	German

The module provides classification, structure and function of networks with a focus on communication protocols and integrates basic components of distributed systems. For this it uses the popular layered models and architectures. Concepts and procedures independent of the layers are addressed separately, in order to specialise them by examples of communication protocols in all major layers of the model. These include the physical layer, the data link layer including multiple access, the network layer, the transport layer, and also the Internet Service Protocols. The presentation and the communication layers are introduced with concepts from the communication middleware for distributed systems. As an outlook for the operation of distributed systems, the module treats summarily the basics of Internet management.

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

# **Qualifikation Aims**

The qualification aims are:

- Understanding of the methods and techniques in computer networks and distributed systems;
- Ability of classification and evaluation of new protocols;
- Understanding of distributed applications and their relation to the properties of the underlying network.

## Contents

The seminar focuses on social authority and self authority. Social authorities are in particular communicative authority, authority for the technology of communication, authority to handling partners, authority for the conflict recognition and conflict management, authority for the dissolution of conflict situations, intercultural authority, social project management/team ability, authority for the controlling of the interior relations, authority for the support of the external relations. Self authorities are in particular reflection/criticism ability, flexibility, motivation, learning and readiness to perform, perseverance and reliability, ethics and responsibility.

## **Qualifikation Aims**

The students learn, to present their ideas and proposals convincingly in written and oral form, to recognise different positions and opinions of their partners and to integrate them in appropriate solutions, even if their partners are not familiar with the way computer scientists talk and think. In addition skills in conflict management are necessary to argue goal oriented in controversy discussions and to accept critics in a positive way. The ability to recognise and resolve misunderstandings early. Furthermore, the ability to recognise the impact of informatics on the social, economical, psychological, legal aspects as well as aspects pertaining to labour law of the society will be developed.

## Contents

This module comprises the Bachelor Thesis and the final examination.

The students solve a nontrivial problem with scientific methods and document the solution within 10 weeks time. The examination consists of a presentation of the Bachelor Thesis (about

 $20\,$  min.), followed by maximally  $20\,$  minutes discussion about the Bachelor Thesis and related topics.

## **Qualifikation Aims**

The students learn to solve a nontrivial problem with scientific methods and document the solution in a given time.

## Contents

The module consists of an introductory phase where the basic programming techniques that are needed for the later work, are introduced. In the second phase a complex software development project will be implemented in teams of three to six students. The main focus of the module is to get experience in team-oriented software development using generally available tools and methods.

The practical work is accompanied by a plenary session, in which the software development techniques necessary for the project are discussed. This typically includes programming with programming libraries, graphics programming, aspects of object-oriented analysis, introduction to client-server programming and the use of software management tools. In addition actual problems which showed up in the current phase of the project are discussed.

The students work independently in small teams. Each team is assigned an adviser who helps the team in the upcoming tasks.

## **Qualifikation Aims**

The software development internship provides practical experience in team-based development of a larger and complex software system using commonly available tools and methods. The goal is to develop the ability to develop in a small team a major software project. Upon successfully completing the software development internship, the participants should dare to take a student job in the IT industry.

## Remarks

For the successful completion of the practical course basic knowledge of the Java programming language is essential.

# 2.19 WP 2: Practical Training in Operating System Development (INF-SysP)

# Contents

This practical training in system development covers selected problems and challenges in the area of system programming. Basic knowledge in a programming language is no prerequisite. An accompanying lecture gives an overview about the necessary basics using C. In any case, it is reasonable to have basic knowledge in an imperative programming language such as e.g. C/C++, Pascal or Java and the use of text editors at hand.

# **Qualifikation Aims**

It is the goal to learn system programming using C. The topics and exercises cover for example interface specifications, modular software development, formatted I/O, parsers and parsing, CPU scheduling, processes and their management, inter-process communication and process synchronization, signaling, pipes, sockets, communication protocols, the TCP/IP protocol family as well as the client/server programming model.

# **3** Special Topics

The subsequent list of modules are a selection of modules which can be acknowledged as Special Topics modules. These modules are serve the broardening and deepening of the knowledge and abilities. Several of them are based on the current focus in the research of the teaching staff and thus serve the consequent implementation of the principle of research orientation in teaching. By visiting these modules students are already introduced to current issues in research early on and gain insight into the further development of the subject. Modules from the Master Programmes can be recommended only for those students who have shown so far excellent results in their studies.

# Contents

This module provides an overview of the possible intellectual property rights. It also serves to highlight specific courses of action for the protection of developments in the field of computer science. In addition to non-technical property rights, such as trademark, design rights and copyright, a special focus will be given to technical rights like patent rights and utility model rights. Besides the question "How can I protect my development from imitation?" the module also addresses the problem to enforce acquired protection rights.

## The main topics include:

- Technical property rights (Patents, utility patents, property right strategies),
- Computer implemented inventions (Copyright protection, license agreements, patent protection for computer implemented inventions),
- Trademarks (trademark rights, trademarks, protection of trademarks, requirements for protection, infringement of trademarks),
- Design patents, employee invention law,
- Violation of intellectual property rights.

## Recommended Literature:

- Andreas Heinemann, Patent- und Designrecht: PatR, 12. Auflage, ISBN-13: 978-3-406-66154-9,
- Volker Ilzhöfer und Rainer Engels, Patent-, Marken- und Urheberrecht: Leitfaden für Ausbildung und Praxis, 8. Auflage, ISBN-13: 978-3800637270,
- Fachzeitschriften: "Mitteilungen der deutschen Patentanwälte", "GRUR", "GRUR Int.", "Computer und Recht".

The module consists of a lecture and an additional exercise class. The concepts introduced in the lecture are deepened in the exercise part with practical cases. New content may be discussed or – depending on the number of participants – worked out in practical exercises.

## **Qualifikation Aims**

The students gain an understanding of the basic principles and the possibilities in intellectual property laws. In particular, background knowledge about useful protection possibilities in computer science with respect to the exciting topic of *software patents* is put across. The student acquires the necessary skills to understand and assess these protection options in computer science.

## Contents

The module KDD I gives an introduction to the basics of automatic and semi automatic knowledge discovery from electronic data repositories. The module describes the general process as well as the major tasks and approaches.

#### Knowledge Discovery and Data Mining

- Definition Knowledge Discovery and Data Mining
- KDD Process (different steps, iterative approach)
- Supervized and unsupervized learning
- Basic Data Mining tasks: Classification, Clustering, Outlier Detection, Regression, Frequent Pattern Mining.

#### Feature Spaces

- Probability distributions (simple univariate and multivariate distributions, dependency of random variables)
- Distance and similarly measures (mathematical characteristics such as reflexifity, symmetry, transitivity)
- Examples for simple feature transformations (e.g. color histograms, bag of words).

#### **Optional Topics**

- simple methods for feature selection (e.g. greedy forward selection)
- simple methods for feature reduction (e.g. PCA).

#### Classification

- Classifier evaluation (testing schemes e.g. cross validation, bootstraping, leave-one-out, evaluation metrics)
- Formal aspects of learning (generalisation, overfitting)
- Decision trees
- Bayes classifier (naive Bayes, Baysian networks)
- instance based Classification.

## **Optional Topics**

- advanced classification methods (e.g. support vector machines, neuronal Networks, Gaussian classifiers, logistic regression)
- rule-based classifiers and inductive logical programming
- deep learning.

## Regression

- Problem definition (Evaluation of regression functions)
- Simple linear regression
- Basic methods for multivariate regression
- Advanced regression methods (e.g. kernel based regression, instance-based regression)

## Clustering

- Problem definition (aims, difference to classification)
- Partitioning clustering methods ( k-Means, expectation maximization, further methods e.g. PAM, CLARANCE, k-Modes)
- Density-based and hierarchical clustering (e.g. DBSCAN, OPTICS, Single Link).

## **Optional Topics**

- Self organizing maps
- Graph-based clustering and spectral clustering
- Evaluation of clusterings.

## **Outlier Detection**

- General setting (various outlier definitions, differences to clustering and classification)
- statistic outliers
- distance-based outliers
- local outlier (e.g. LOF).

## **Optional Topics**

- Advanced methods for outlier detection (e.g. ABOD)
- Evaluation of outlier detection methods.

## Frequent Itemset Mining and Association Rules

- Introduction to Pattern Mining (Frequency, Confidence, Monotony)
- Frequent Itemset Mining (Search space, apriori method)
- Assocition rules (computation, interestingness).

## **Optional Topics**

- Advanced algorithms for frequent itemset computation
- Data strutures to facilitate frequent itemset mining.

## Literature

- Han J., Kamber M., Pei J.Data Mining: ConceptsandTechniques3. Auflage, Morgan Kaufmann, 2011
- Tan P.-N., Steinbach M., Kumar V. Introduction to Data MiningAddison-Wesley, 2006
- Mitchell T. M. Machine Learning McGraw-Hill, 1997
- Ester M., Sander J.: Knowledge Discovery in Databases: Techniken und Anwendungen Springer Verlag, September 2000
- Witten I. H., Frank E., Hall M. A.Data Mining: Practical Machine Learning Tools and Techniques 3. Auflage, Morgan Kaufmann, 2011

The module consists of a lecture and an addition exercise class. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

## **Qualifikation Aims**

After completing this modul the participants should be familiar with the following topics:

- the process of knowledge discovery in databases and the single steps involved in the process,
- basic tasks and approaches in data mining.

The Participants of the module should be able to:

- analyze and formally describe feature spaces, similarity measures and distance metrics,
- employ and implement basic methods for the data mining tasks being introduced in the module,
- evaluate computed patterns and functions.

Based on the learned knowledge and abilities the participants obtain the skill to:

- design and implement knowledge discovery processes for given problems,
- select the best suited among the introduced data mining methods for a given problem.

# Contents

The module contains advanced techniques providing solutions for the challanges of complex, large and volatile data collections.

## Big Data Analytics and Data Science

- Introduction to the topic and background
- Challenges (volume, velocity, variety, veracity)
- Relationship to other research areas.

## Data Mining in Large Data Repositories

- General approaches(sampling, micro-clustering, parallel computing)
- Sampling and micro-clustering techniques(z.B. cluster features, BIRCH, data bubbles)
- Parallel and distributed data mining (general principles, workflows, approaches to parallel knowledge discovery)
- Basic parallel and distributed data mining algorithms and their implementation
- Privacy Preserving Data Mining (risks, simple attacks, basic methods: data swapping, data perturbation, discretization).

## **Optional Topics:**

- Complexe attacks to privacy and counter measures
- Privacy preserving data mining algorithms.

## Data Mining on Volatile Data

- Stream data mining(basic problem setting, aging, concept drift, online and streams data mining)
- Algorithms for stream clustering
- Algorithms for stream classicition.

## **Optional Topics:**

- Advanced techniques for data aggregation in data streams
- Stream mining algorithms for further data mining tasks (e.g. frequent pattern mining in streams).

## High Dimensional Data

- Feature selection (redundance and relevance of features, search space, problem complexity)
- Feature and subspace evaluation(supervized and unsupervized criteria)
- Search algorithms for feature selection( forward selection, backward elimination, branch and bound)
- Feature reduction and metric learning( definitions and connection with related approaches)
- Linear feature reduction (principle component analysis, singular values decomposition)
- Clustering in high dimensional data spaces (top-down approach, buttom-up approach, locality assumption)
- Algorithms for clustering high-dimensional data (e.g. Clique, SubClu, 4C, Proclus, CASH, Co-Clustering).

#### **Optional Topics**

- Advanced methods for supervized metric learning(e.g. Fisher faces, RCA, LMNN )
- Manifold learning.

#### **Compound Data Objects**

- Basic concepts of Ensemble learning (methods for generating diversity, combination functions)
- Ensemble techniques (e.g. Bagging, Boosting, ECOC)
- Multiview Data Mining (Composed feature spaces, Multiview distance measures, multiview algorithms, kernel combination)
- Multi-Instance Data Mining (Definition and connection to multiview data)
- Multi-Instance distnace measures(e.g. Hausdorff distance)
- Multi-Instance data mining algorithms (multi-instance learning, concept-based learning).

#### Link Mining and Graph Mining

- Introduction to graph mining tasks (e.g. link prediction, dense subgraph discovery, centrality measures, subgraph mining)
- Distance measures between graphs (graph isomorphism, graph kernels, topological descriptors)
- Distance measures in graphs (e.g. random walk with repeat, shortest path)
- Centrality in networks(e.g. pagerank, Betweeness centrality)
- Link-Prediction (matrix factorization, classification)
- frequent subgraph mining (subgraph isomorphism, normal forms, algorithms e.g. GSPAN)

#### **Recommended Literature**

- Han J., Kamber M., Pei J.Data Mining: ConceptsandTechniques3. Auflage, Morgan Kaufmann, 2011
- Tan P.-N., Steinbach M., Kumar V. Introduction to Data MiningAddison-Wesley, 2006
- Mitchell T. M. Machine Learning McGraw-Hill, 1997.

The module consists of a lecture and an addition exercise class. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

# **Qualifikation Aims**

With completing this modul the participants should be familiar with the following topics:

- problems and challenges of the analysis of real data repositories such as volume, velocity and complexity
- Approaches to handle high dimensional, complex structured adn linked data
- Approaches to handle volatile data
- Various setting and solution strategies in parallel and distributed Environments.

The participants of the module should be able to:

- Develop and apply data mining algorithms for complex and linked data
- Implement parallel and distributed data mining algorithmes
- Develop and implement data mining algorithmens in volatile systems.

Based on the learned knowledge and abilities the participants obtain the skill to:

- Design and develop knowledge discovery processes in large, volatile and/or complex data facilitating the establishd tools
- Evaluate the suitability of the introduced methods for given data sets and applictions and to select the well-suited methods.

#### Contents

Software engineering is the discipline of engineering large software systems. This comprises the provisioning and use of methods, procedures and tools for developing, running and maintaining software systems.

The topic of this module is the entire process of software development. It ranges from the requirement specifications over the software architecture up to the verification, validation and test. Further topics are formal methods, software process and a particular application domain. The UML-notion is the golden thread in the lecture. The lecture connects practical topics with the theoretical basis of software development.

The module consists of a lecture and of additional exercises in groups. The concepts introduced in the lecture are trained in the exercises by means of practical applications. Particular software development tasks are solved with systematic methods.

## **Qualifikation Aims**

The students shall get an overview of the most important procedures, methods and techniques for the systematic development of software systems. They should be able to propose approaches for solving practical software development problems and to implement them in a systematic way.

## Contents

For different programming paradigms and different application areas it is necessary to have specifically tailored development techniques. This module gives an overview of software engineering methods for special application areas. These are, in particular, parallel and distributed systems, embedded systems, web applications, as well as systems relying on non-functional properties like performance and security.

The module consists of a lecture and of additional exercises in groups. The concepts introduced in the lecture are practiced in the exercises by means of particular software development tasks.

## **Qualifikation Aims**

The students should become familiar with systematic software development techniques for one of the above mentioned application areas and to apply them to concrete examples. They should get an overview about the basic software engineering methods for this application area and they should be able to propose and asses working solutions for practical problems in this area.

Lang.

Parallel computing encompasses the concurrent use of multiple cores to solve a given problem. Historically parallel computing has its roots in the area of scientific and high-performance computing (HPC), where today's Supercomputers are composed of a million computing cores and more. In recent years parallel computing has expanded its reach into almost all areas of the computing industry. Universally, servers, desktops, and notebooks are today equipped with multicore CPUs, a trend that is recently also expanding into the area of smartphones and tablets. In all cases the only way to make efficient use of the available hardware resources is the explicit parallel programming and parallel computing is thus increasingly becoming a "must have skill" for IT professionals.

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

## **Qualifikation Aims**

The lecture is composed of three interwoven topical areas: parallel architectures, parallel algorithms and parallel programming. The successful participants will be able to identify independent parallel tasks in a variety of settings and create efficient realizations of algorithms on computing platforms that range from smartphones over accelerators to supercomputers such as SuperMUC at the Leibniz Supercomputing Centre.

Entry Requ.	none
Time during the study	1. Semester (MINF-M-120-KW, MINF-M-120, INF-M-120, MINF-M-120- MCI, MINF-M-120-MG, MINF-M-120-MW), 3. Semester (INF-M-120), 5. Semester (INF-B-120, MINF-B-180)
Duration	The module comprises 1 semester.
Grading	marked
Type of Examination	Klausur (90-180 Minute) oder mündlich (15-30 Minute) Repeatability: arbitrary, Admission Requirements: none
Responsible for Module	Prof. Dr. Dieter Kranzlmüller

Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science Communication Systems and System Programming Group
Teaching Lang.	German

## Contents

This module addresses particular security requirements and mechanisms as well as their realisation in distributed systems. It addresses the theoretical foundations and concepts of IT- and network security. These are in particular questions from areas like security engineering, threats and hazards, cryptography as well as different kinds of security mechanisms and their realisation.

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples, for example, firewall configuration or cryptography. The students get practical experience in installation and maintenance of security relevant systems, applications and components.

## **Qualifikation Aims**

The students develop a general understanding of the different kinds of security threats in distributed systems and they learn about the technical possibilities to counteract these threats.

## 3.8 VT 8: Geographic Information Systems (INF-GIS)

**Part of:** Bachelor Programme in Computer Science with 60-CP Minor Subject (120 CP) Associated Module Components:

Teaching	Component	Rota	Attendance	Selfstudy	ECTS
lecture	Lecture: Geographic Information Systems	WiSe	45 h (3 SWS)	45 h	3 CP
exercise	Exercises: Geographic Information Systems	WiSe	30 h (2 SWS)	60 h	3 CP

6 credit points are awarded for this module. The attendance time is 5 hours a week. Including self-study, there are about 180 hours to be spent.

Type	elective module with compulsory module components
Entry Requ.	none
Time during the study	5. Semester
Duration	The module comprises 1 semester.
Grading	marked
Type of Examination	Klausur (90-180 Minute) oder mündlich (15-30 Minute) Repeatability: arbitrary, Admission Requirements: none
Responsible for Module	Dr. Peer Kröger
Provider	Ludwig-Maximilians-University Munich Faculty for Mathematics, Computer Science and Statistics Institute for Computer Science Core Computer Science
Teaching Lang.	German

## Contents

The course deals with the principles of geographic information systems (GIS), which are used in various applications for the collection, management, analysis and output of multidimensional geometric data (eg, geography, cartography, surveying and power supply). The aim of the lecture is to present the relevant GIS data structures and algorithms, and to present their implementation aspects. A special topic is the use of database systems for the management of geometric objects. In particular, suitable algorithms for querying, access structures, data models and query languages are presented.

#### **Recommended Literature**

- Philippe Rigaux, Michel Scholl, Agnes Voisard: Spatial Databases With Applications to GIS. Morgan Kaufmann, 2001.
- Mark de Berg, Otfried Cheong, Marc van Kreveld, und Mark Overmars: Computational Geometry: Algorithms and Applications. Springer, Berlin, 2008.

The module consists of a lecture and in addition exercises in small groups. The concepts introduced in the lecture are practiced in the exercise class with concrete examples.

## **Prior Knowledge**

Recommended: basic knowledge in algorithms and data structures as well as in database systems

## **Qualifikation Aims**

The students are acquainted to properties of spatial data relevant to the management of such data in diverse applications (eg, geography, cartography, surveying and power supply).

The students are acquainted to the foundations and applications of GeoInformation Systems (GIS) and are able apply concepts and models to spatial data.

The students are acquainted to methods for the management of spatial data and for efficiently query processing in spatial data.

The students are acquainted to basic techniques from computational geometry and are able to apply these techniques to real problems.

The students are acquainted to spatial index structures (eg, Quadtree, R-Trees).

# 3.9 VP 1: Practical Course Computer Networks (INF-PRN)

# Associated Module Components:

Teaching	Component	Rota	Attendance	Selfstudy ECTS
practical training	Practical Course Computer Networks	WiSe	90 h (6 SWS)	270 h 12 CP

12 credit points are awarded for this module. The attendance time is 6 hours a week. Including self-study, there are about 360 hours to be spent.

Type	elective module with compulsory module components
Usability	<ul> <li>This module is offered in the following programmes</li> <li>INF-B-120: Bachelor Programme in Computer Science with 60-CP Minor Subject</li> <li>INF-B-150: Bachelor Programme in Computer Science with 30-CP Minor Subject</li> <li>INF-B-180-CL: Bachelor Programme in Computer Science plus Computer Linguistics</li> <li>INF-B-180-MA: Bachelor Programme in Computer Science plus Mathematics</li> <li>INF-B-180-STAT: Bachelor Programme in Computer Science plus Statistics</li> <li>INF-B-180: Masters Programme Computer Science</li> <li>MINF-M-120: Masters Programme in Media Informatics</li> <li>MINF-M-120-KW: Masters Programme Human-Computer Interaction</li> <li>MINF-M-120-MG: Masters Programme Media Informatics with Media Design</li> <li>MINF-M-120-MW: Masters Programme Media Informatics with Media</li> </ul>

#### Entry Requ. none

Time during the study	2. Semester (MINF-M-120-KW, MINF-M-120-MCI, MINF-M-120-MG, MINF-M-120-MW), 3. Semester (INF-M-120), 5. Semester (INF-B-180-STAT, INF-B-120, INF-B-180-MA, INF-B-150, INF-B-180-CL, MINF-B-180)
Duration	The module comprises 1 semester.
Grading	marked

## Contents

The computer networks lab course provides insights around the technical details of computer networks and network management. The module course 'Computer networks and distributed systems' is the theoretical prerequisite for this lab course.

The topics and exercises are organised in accordance with the ISO/OSI reference model and encompass:

- optical communication;
- virtual local area nets (VLANs);
- configuration of IPv4 and IPv6 networks;
- routing within and between autonomous systems;
- auxiliary and configuration protocols;
- application layer protocols;
- network management.

## **Qualifikation Aims**

The students learn:

- administration of network components: switches, routers, wavelength division multiplexers, etc.;
- construction and configuration of networks and associations of networks;
- proficient use of tools for networks analysis and configuration;
- use of software packages for Internet services and network management.

# 3.10 VP 2: Practical Course on Innovative Mobile Business Applications (INF-MBA)

## Contents

The course takes places in cooperation with an industry partner and consists of two stages. The first stage is made up of three theoretical sessions during lecture period, which are used for presenting the ongoing topics to the students and for the formation of working groups. The participants then have the possibility to discuss the topics as well as to introduce their own ideas and proposals. Eventually, tasks will be assigned to the working groups in order to create conceptual designs for each topic.

In the second stage the participants will practically implement the developed concepts. Over the time of two weeks the students will work in groups on the system's implementation (if possible at the industry partner's site). The practical course concludes with a presentation of the results on behalf of the participants.

Typically, this course involves the following aspects:

- mobile application development (e.g., for iOS or Android),
- delevopment of corresponding databases and backend systems (usually Java-based),
- realization of hardware-based functionalities using specialized platforms, such as RaspberryPi or Arduino boards.

Participants are working autonomously in teams of usually about four to six persons, while intensively being supported by staff from the Lehrstuhl and the industry partner.

## **Prior Knowledge**

Profound knowledge of object-oriented software development and distributed systems

## **Qualifikation Aims**

The practical course offers its participants the possibility to design and implement innovative solutions for current topics in cooperation with a partner from industry. Participants will gain practical experience concerning the realization of innovative IT projects. This provides challenges for the students on different levels: (unforeseeable) technical difficulties have to be overcome, working groups must organize themselves and act as a team even under pressure. Participants will learn to put their existing knowledge to good use as well as to quickly and autonomously acquire new knowledge.

Apart from challenges such as solving unknown problems and understanding new technologies, non-technical tasks such as project management, communication with real customers and presentation of results have to be accomplished.

# 3.11 VP 3: Practical Course on iOS Development (INF-IOS)

Teaching	Component	Rota	Attendance	Selfstudy	ECTS

## Contents

The module consists of a theory and a programming phase. Starting with the theory phase the basics for the program development for the iOS operating system will be taught. It consists of an introduction to the programming language Objective-C, object-oriented programming with message passing, as well as an overview of the architecture of the operating system. Important aspects of the Foundation Framework and some selected core frameworks are presented. The theory classes provide the central ideas and concepts to facilitate a deeper understanding of the relevant themes. In the practical classes, independent iOS applications are designed and developed in teams of 3 to 6 participants. Here, the participants should be able to build on the theoretical foundations. The theory part of the course consists of an interactive lecture. In the practice phase, participants then work independently in small teams.

## The Topics Include:

- Introduction to Objective-C,
- Modell-View-Controller Concept,
- User Interface Components,
- User Interface Navigation,
- Storyboards,
- Notifications,
- iOS State Model,
- Storing State / Data,
- Event Handling (Touches and Gestures),
- Utilizing Sensors,
- Utilizing Built-In Databases,
- Utilizing Communication Interfaces and Libraries,
- Threading and Dispatch-Queues.

#### **Recommended Literature:**

• iOS Programming - The Big Nerd Ranch Guide (4th Edition) (Big Nerd Ranch Guides)

The theory part of the course consists of an interactive lecture. In the practice phase, participants then work independently in small teams.

# Prior Knowledge

Profound knowledge of object-oriented software development.

# **Qualifikation Aims**

The module provides an introduction to the iOS development using Objective-C. The participants will develop the ability to quickly become familiar with a largely unknown programming language and operating system such that they can implement their ideas. Previous knowledge of the (object-oriented) software development is certainly helpful.

# 3.12 VP 4: Practical Course on Mobile Business Applications (INF-PMVS)

Teaching	Component	Rota	Attendance	Selfstudy	y ECTS
lecture	Lecture for the Practical Course on Mobile Business Applications	WiSe, SoSe	30 h (2 SWS)	30 h	2  CP
practical training	Practical part of the Practical Course on Mobile Business Applications	WiSe, SoSe	60 h (4 SWS)	60 h	4 CP

# Associated Module Components:

6 credit points are awarded for this module. The attendance time is 6 hours a week. Including self-study, there are about 180 hours to be spent.

# Contents

The module consists of weekly theoretical and practical events. In the theoretical lecturs, basic mechanisms, concepts and methods are presented, which are the basis for the practical implementation of mobile applications and distributed systems. Topics to be covered include wireless local area networks and mobile networks, positioning techniques for outdoor and indoor environments, as well as the architectures of distributed systems and the basics of location-based services. In the practical part, the participants work in small groups of 2-3 people to put the theoretical concepts into practice. The programs are developed for Android and Linux.

## Contents of the practical course:

- Introduction to Android,
- Outdoor positioning,
- Indoor positioning,
- Wireless communication technologies: WiFi, Bluetooth, NFC,
- Context-sensitive systems,
- Location Based Services,
- Client-server architectures and communication, REST.

In the theortical part the basic concepts necessary for the practical implementation are introduced. In the practical part the participants then work independently in small teams to solve the programming tasks.

## Prior Knowledge

Basic knowledge of Java, as well as in the field of computer networks

## **Qualifikation Aims**

The practical course gives the participants an overview of different sub-regions in the research area of mobile and distributed systems and also offers an introduction to programming mobile applications for Android on Linux. In addition, the correct handling of Web standards and the use of software frameworks is learned. Prior knowledge of software development with Java are therefore certainly helpful.

# 4 Curriculum

The course can only be started in the winter semester. The plan is only a suggestion. Every student is free to follow another curriculum which is compatible with the examination regulations.

# 1. Semester (WiSe)

Shortname	Component	CP
INF-EiP	Introduction to Programming	9
INF-GAI	Foundations of Analysis for Computer Scientists	3
		12
